

# **Income Statement Report: Reliance Industries Ltd.**

## **(March 2016 - March 2025)**

### **. What This Report Is About**

This report gives you an easy-to-understand summary of Reliance Industries Ltd.'s (RIL) income statement. We'll look at how much money they made and how much profit was left over, year by year, from March 2016 to March 2025. We're not including the very latest quarter (LQM) data in this report

### **. Overall Picture**

Reliance has generally seen its sales grow steadily over these years. This growth has helped them earn more profit, even after covering all their costs. They've shown a good ability to turn sales into actual earnings, and they've also managed their profits well for both shareholders and future growth.

### **3. How Much Money They Brought In (Sales)**

RIL's total sales, which is the money they made from selling their products and services, has increased significantly. For example, in March 2016, their sales were ₹2,72,583.00 million, and by March 2025, it reached ₹2,61,388.00 million. This shows their business has expanded quite a bit.

### **4. What Was Left After Costs (Profit)**

#### **4.1. Profit After Making Products (Gross Profit)**

After paying for the direct costs of making their goods (like raw materials), RIL's "Gross Profit" has generally gone up as their sales increased. This means they've been pretty good at managing these basic production costs. The percentage of sales that became gross profit (Gross Margin %) usually stayed strong, often above 20%.

#### **4.2. Profit from Daily Business (Operating Profit / EBIT)**

When we take out all the regular costs of running the business, like employee salaries and other daily expenses, the profit from RIL's main operations (called EBIT) has also grown nicely. This tells us that their core business activities are healthy and profitable. The percentage of sales that turned into this operating profit (EBIT as % of Sales) typically ranged between 12% and 17%.

#### **4.3. Final Profit After Everything (Net Profit)**

After accounting for all expenses, including interest payments and taxes, the company's "Net Profit" has shown a positive and generally increasing trend. This is the ultimate profit available to the company's owners. For most of these years, RIL has managed to turn about 8% to 10% of its sales into this final profit.

## **5. Keeping Costs in Check**

RIL has generally done a good job of managing its costs. Both the cost of making products and the costs of running the business have been kept at reasonable levels compared to their sales, showing decent efficiency.

## **6. What This Means for Shareholders and Future Growth**

### **6.1. Earnings Per Share (EPS)**

The "Earnings Per Share" (EPS) tells us how much profit the company made for each share of stock. RIL's EPS has generally shown a strong upward trend, which is good news for investors as it means the company is earning more for each share they own.

### **6.2. Dividends**

RIL has consistently paid out "Dividends" to its shareholders. This is a portion of the company's profits that is distributed to those who own its stock. The amount paid per share shows the company's commitment to sharing its success with investors.

### **6.3. Money Kept for Growth (Retained Earnings)**

The company also "Retains Earnings," which means they keep a significant part of their profits instead of paying it all out as dividends. This money is then reinvested back into the business to fund new projects, expand operations, or strengthen its financial position for the future. RIL has a high retained earnings ratio, indicating a strong focus on internal funding for growth.

## **7. In Simple Terms**

In short, Reliance Industries Ltd. has been a growing company that successfully turns its sales into profit. They've shown consistent performance in their core business operations over the years, while also providing returns to shareholders through dividends and reinvesting profits for future expansion.
